Table 1. See	Table 1. Seeking Safety Status since inception to July 15, 2015									
# of Clients Claimed to Practice	# of Clients entered into PEI OMA	# of Tx cycles in PEI OMA	Clients with Multiple Tx Cycles	Clients Completing Tx	Clients Dropping- Out of Tx	Clients Still in Tx				
21464	58.82%	13605	6.89%	26.56%	40.04%	33.40%				
n=	12626	n=	870	3614	5447	4544				

Note 1: Clients claimed was based on Seeking Safety being selected as the EBP in a PEI Plan and having ≥ 2 core services claimed to the practice.

Note 2: Number of clients Completing Tx or Dropping-Out of Tx was determined by whether the EBP was said to be completed (e.g. answered "yes" or "no") in the PEI OMA.

Table 2. Client Demographics - Clients Who Entered Seeking Safety												
	Age	e Gender				Ethnicity			Prim	Primary Language		
Total Number of Clients	Average	Female	Male	Unknown	African- American	Asian / Pacific Islander	Caucasian	Hispanic / Latino	Other	English	Spanish	Other

NT. (. 1 . NT 1	1 1 1		

Note 1: Number of acknowledged measures (Ackn=) is determined by the number of required measures that receive a score or an unable to collect reason code.

Note 2: The % indicated for Pre-test with scores, Post-test with scores, and both a Pre- and Post-test with scores is calculated by dividing the (n=#) by the number acknowledged (Ackn=#) in the PEI OMA system for each measure. The number acknowledged (Ackn=#) for those with Pre and Post scores is an estimate based on the greatest number of matches that could be expected given the number of Pre scores acknowledged.

[±]Please see Appendix A. for a description of the Seeking Safety outcome measures and the outcome indicators (percent improvement in average scores; and, percent of clients showing reliable change).

Note1: Possible PTSD-RI range from 0-68, with a clinical cutpoint of 38.

Note2: Possible YOQ Total Scores range from -16-240, with a clinical cutpoint of 46.

Note3: Possible YOQ-SR Total Scores range from -16-240, with a clinical cutpoint of 47.

Note4: Possible OQ Total Scores range from 0-180, with a clinical cutpoint of 64.

Note5: Positive Change indicates that the scores decreased from the pre to the post measures.

UCLA PTSD RI – Child/Adolescent (N=1082)

UCLA PTSD-RI – Adult (N=303)

Youth Outcome Questionnaire (YOQ) – 2.01 (Parent) (N=606)

<u>Youth Outcome Questionnaire – Self Report – 2.0 (YOQ-SR)</u> (N=1329)

Outcome Questionnaire-45.2 (N=486)

<u>Appendix</u>

Youth Outcomes Questionnaires (YOQ and YOQ-SR)

The Youth Outcome Questionnaire is a 64-item parent-report that assesses global distress in a child's/adolescent's life from 4-17 years of age. The YOQ-SR is the Self-report version of the YOQ and is completed by the child/adolescent. Total scores on both measures can range from -16 to 240. Total scores of 46 or higher are most similar to a clinical population on the YOQ. A total score of 47 is most similar to that of a clinical population on the YOQ-SR.

Outcomes Questionnaires (OQ)

The Outcome Questionnaire is a 45-item self-report that assesses global distress in a client's life from ages 19 and older. Total Scores on this measure can range from 0 to 180, with scores of 64 or higher indicating clinical significance.

Post-Traumatic Stress Disorder Reaction Index (PTSD-RI)

The UCLA Post-Traumatic Stress Disorder Reaction Index (PTSD-RI) is a brief (21 or 22-item measure depending on the version) that measures the frequency of occurrence of post-traumatic stress disorder symptoms during the month prior to the assessment. The Child/Adolescent Version is appropriate for clients age 6-20. The Parent Version is appropriate for clients age 3-18. The Adult Short-form is appropriate for clients age 21+.

Possible Total PTSD Severity Scores range from 0-68; and scores of 38 or higher have the greatest sensitivity and specificity for detecting PTSD.

Reliable Change Index (RCI)

When comparing Pre and Post scores, it is very helpful to know whether the change reported represents the real effects of the treatment or errors in the system of measurement. The Reliability of Change Index (RCI) is a statistical way of helping to insure that the change recorded between pre and post assessments exceeds that which would be expected on the basis of measurement error alone. The RCI has been calculated using the Jacobson and Truax (1991) method and indicates when change exceeds that which would be expected on the basis of error at the p<.05 probability level. For a more in-depth discussion of Reliability of Change see Jacobson, N. S., & Truax. P. (1991). Clinical Significance: A statistical approach to defining meaningful change in psychotherapy research. *Journal of Consulting and Clinical Psychology*, 59, 12-19. Also see Wise, E. A. (2004). Methods for analyzing psychotherapy outcomes: A review of clinical significance, reliable change, and recommendations for future directions. *Journal of Personality Assessment*, 82(1), 50-59.

The number and percent of clients experiencing positive change, no change and negative change are recorded in table 7. Healthful change in each of the measures cited here means that scores have <u>decreased</u> in value from pre to post test administrations (i.e. recorded a negative change on the RCI). To help avoid confusion, healthful reliable change is presented as positive while unhealthful reliable change is presented as negative change.

The Reliable Change analysis for the PTSD-RI Adult Short-Form used the same Cronbach Alpha score found in the other PTSD-RI versions.
